

Spa 2 closing

- 1- To empty, open the valve installed at the base of the SPA. This valve is designed to connect to a garden hose. Leave the valve open once the SPA is empty.
- 2- Remove the basket and the cartridge in the skimmer.
- 3- Disconnect the piping from the pump and the water heater.
- 4- Drain the pump by unscrewing the drain nut located at the base of the pump.
- 5- With a Shop Vac, blow air in the suction pipe (pump to SPA).
- 6- Blow air in the return pipe (water heater to SPA). Ensure that you can hear air blowing out of your jets. If some jets are still blocked, close the ones that are blowing air. This will force the air through the remaining jets.
- 7- Empty the skimmer, if needed, and insert 2 Styrofoam tabs.
- 8- Leave return and suction valves open.
- 9- Build a watertight cover over the SPA to prevent water from getting in.
