

## HOW TO USE THE VACUUM.

- Connect the telescopic pole to the vacuum.
- Take the vacuum hose and check both ends of the hose: one end swivels and the other is fixed. Place the swivelling end of the vacuum hose to the head of the vacuum and lower it to the bottom of the pool.
- Fill the vacuum hose with water to eliminate the air pockets inside the hose. (Tip: place the hose in front of a return jet to properly fill it with water).

- Remove the basket from the skimmer and place the valve's red lever at the bottom of the skimmer in the vertical position. The bottom drain will then close and there will only be a single suction concentrated in the skimmer.

- Replace the basket in the skimmer.

- Connect the fixed end of the vacuum hose to the Skim-Vac. Place the Skim-Vac above the basket. This way, the debris that could possibly block your lines will remain in the skimmer's basket. The rest of the debris that will be sucked up will be directly sent to your filter.

- Vacuum the water slowly to avoid creating too much stir and ensure an effective cleaning.

- ❖ If the suction is diminished, verify the basket in the skimmer. Then, verify the pump's basket. If this situation persists, verify the gauge at the top of the filter and if the reading indicates 5 pounds or more than a normal pressure, a Backwash must be performed.
